

Recycled Materials Policy

Recycled materials are used in the manufacture of our products. This varies by application as some of the more robust, impact style products like posts and traffic rails need to meet stringent safety criteria. As a business we constantly review components to reduce plastic to improve carbon footprint throughout the design and manufacturing lifecycle, aiming to reduce our usage of raw material all the way through to consideration of lower transport weights.

A-SAFE's selection in material is meticulous to ensure a long life-span and aligned to our design intent, providing a product which can withstand multiple impacts over a long period of time compared to single use materials which requires more regular replacement. Our product lifecycle runs through a cradle to grave process, therefore any parts manufactured by A-SAFE can be brought back and will go through a full recycling process.
